

# california safety requirements

In addition to being the more durable and attractive choice, powder coating is also highly protective of our environment. Powder coatings contain no solvents and therefore emit negligible, if any, polluting VOCs into the atmosphere. Powder coating is a clean process, allowing exhaust air from the coating booth to be returned to the plant, and less oven air is exhausted to the outside.

All Fleetwood products have been awarded UL GreenGuard Gold certification and are tested regularly for certification to that standard.

All Fleetwood products exceed the CARB 2 standards for formaldehyde emissions for particle board. We utilize only high-quality particle board from North American producers.

All Fleetwood furniture products are in compliance with California's Prop 65 regulations for formaldehyde emissions. The results from our ongoing GreenGuard certification testing shows that our products emit less than 25% of "safe harbor" levels.
